EXPERIMENT – Task Analysis and User Flow for an Online Shopping App

SAIPRASHANTH V 240701457

AIM

To analyze and document the sequence of steps a user follows while purchasing a product in an online shopping application and represent the process using a user flow diagram.

DESCRIPTION

Online shopping applications allow users to browse products, select items, add them to the cart, and complete purchases through various payment methods. Task analysis helps identify the user's actions and decision points during the shopping process.

The user flow diagram illustrates how a user moves from the start of the application to successfully placing an order. It includes stages such as login, browsing products, selecting items, adding them to the cart, making payments, and confirming the order.

USER FLOW EXPLANATION

1. Start and Login

The process begins when the user opens the application.
The system checks whether the user has an existing account.

- If the user already has an account, they proceed to **Sign In**.
- If the user does not have an account, they are redirected to the **Register** page to create a new account.

After successful login or registration, the user is taken to the main shopping interface.

---

2. Selecting Product Category

The user chooses a category of products to browse.

Example categories:

- **Men**
- **Women**

Selecting a category displays a list of available shoes under that category.

---

3. Browsing Products

The user browses through the list of shoes displayed in the selected category.
The user can scroll through products and choose one that interests them.

---

4. Viewing Product Details

After selecting a product, the user views detailed information such as:

- Product images
- Price
- Description
- Available sizes
- Reviews and ratings

This helps the user decide whether to purchase the product.

---

5. Selecting Size

The user must select the appropriate shoe size before proceeding.

- If the size is not selected, the system returns the user to browsing or product selection.
- If the size is selected, the user proceeds to the next step.

---

6. Adding to Cart or Wishlist

The user has two options:

- **Add to Cart:** The product is added to the shopping cart for purchase.
- **Wishlist:** The product is saved for future purchase.

If added to the cart, the user can proceed to checkout.

---

7. Payment Process

The user proceeds to the payment stage to complete the purchase.

Available payment methods include:

- **UPI (Unified Payment Interface)**
- **Cash on Delivery (COD)**

If the payment is successful, the system proceeds to order confirmation. If not, the user may return to wishlist or retry payment.

---

8. Payment Confirmation

After a successful transaction, the application confirms that the payment has been processed.

---

9. Shipping Details

The user enters shipping information such as:

- Name
- Address
- Contact number
- Delivery location

This information is used to deliver the purchased product.

---

10. Order Confirmation

Once the shipping details are confirmed, the order is placed successfully.
The system displays an **order confirmation message** to the user.

---

11. End

The process ends after the order confirmation is displayed.

RESULT

The user flow for an online shoe shopping application was successfully analyzed and represented using a flowchart. The diagram clearly illustrates the sequence of actions and decision points involved in browsing products, selecting items, making payments, and confirming orders. This task analysis helps improve user experience and application design.
